

UbuntuSure Insurance - Claims Procedure

Claims Handling Workflow | Demonstration Document

1. Step 1 - Receive Claim

- Capture the customer ID, policy ID, incident details, claim type, claim amount and submission date.
- Confirm that the referenced policy exists.

2. Step 2 - Initial Validation

- Confirm that the policy was active on the incident date.
- Check whether the claim was submitted within the normal 30-day period.
- Check that required supporting information has been supplied.

3. Step 3 - Risk and Value Checks

- Claims above R50,000 require additional review.
- Claims above R100,000 require high-risk review.
- Customers with three or more claims in a rolling 12-month period require additional review.

4. Step 4 - Assessment

- Eligible claims may move from Submitted to Under Review.
- After assessment, a claim may be Approved or Rejected.
- An approved claim may move to Paid once settlement is completed.

5. Escalation

- Cases triggered by high-value, high-risk or repeat-claim rules should be escalated to a human reviewer.
- The AI assistant may retrieve rules and query data, but it must not be treated as the final claims decision-maker.

Portfolio note: This is fictional demonstration content created for an AI/RAG portfolio project. It is not an actual insurer policy or legal document.
